(57) Abstract: Cyclopenta[g]quinazolines of formula (I), and esters and amides thereof may be made by reacting an ester or amide of formula (II), or a protected derivative thereof with a complex containing the (propargyl)Co<sub>2</sub>(CO)<sub>8</sub><sup>+</sup> ion.

WO 03/020706 A1

## PROCESS FOR THE PREPARATION OF CYCLOPENTA[g]QUINAZOLINE DERIVATIVES

This invention relates to a process for the preparation of certain cyclopenta[g]-quinazoline derivatives which are intermediates in the preparation of cyclopenta[g]-quinazoline derivatives which possess anti-cancer activity.

- 5 Cyclopenta[g]quinazoline derivatives which possess anti-cancer activity are disclosed in WO-A-94/11354 (British Technology Group Limited), which discloses tricyclic compounds of formula:

wherein R<sup>3</sup> is a group of one of the following formulae:

10

or R<sup>3</sup> is a *N*-linked naturally-occurring amino acid selected from the group consisting of *L*-alanine, *L*-leucine, *L*-isoleucine, *L*-valine and *L*-phenylalanine.

- 15 Further examples of such compounds are disclosed in WO-A-95/30673 (British Technology Group Limited), which discloses cyclopenta[g]quinazolines of formula:

- 20 The synthesis of these cyclopenta[g]quinazoline-compounds is reported in *J. Med. Chem.*, 2000, 43, 1910-1926 (Bavetsias *et al.*). When R<sup>1</sup> represents a methyl group, R<sup>2</sup> a propargyl group and Ar<sup>1</sup> a 1,4-phenylene group, then 4-{*N*-[(6*RS*)-2-methyl-4-oxo-3,4,7,8-tetrahydro-6*H*-cyclopenta[g]quinazolin-6-yl]-*N*-(prop-2-yn-yl)amino}benzoic acid:

is the key intermediate for the synthesis of this class of compounds, and has been prepared from *N*-(4-{*N*-[(6*RS*)-2-methyl-4-oxo-3,4,7,8-tetrahydro-6*H*-cyclopenta[*g*]-quinazolin-6-yl]-*N*-(prop-2-ynyl)amino]benzoyl]-*L*-glutamic acid by the enzymatic cleavage of its glutamyl residue, as also reported in *J. Chem. Soc., Perkin Trans. 1*, 1999, 1495 (Marriott *et al.*). The propargyl group in this intermediate is introduced under fairly severe conditions by using propargyl bromide and calcium carbonate in DMA [*N,N*-dimethylacetamide] at 100 °C. This reaction is facilitated when an amide functionality is present at a position *para* to the N<sup>10</sup>-H, when compared with a compound having an ester such as CO<sub>2</sub>Bu<sup>t</sup>. Therefore, this step has to be performed on a compound of formula:

This has a glutamyl residue which has to be cleaved to generate COOH again, using the carboxypeptidase G enzyme, which is very expensive. It has in turn been made by amination of a ketone of formula:

No regiospecific synthesis of this cyclopentanone is available, so the synthesis involves oxidation of the corresponding cyclopentane with *tert*-butyl hydroperoxide and chromium(VI) oxide in dichloromethane, and wastefully discarding the isomeric by-product:

The ring-closing step is performed even earlier on in the scheme, by means of the following reaction using hydrogen peroxide and sodium hydroxide in ethanol and water at 50 °C:

5

Thus the prior art might be summarised as the following main steps:

- ring closure;
- protection;
- oxidation;
- 10 • reductive amination;
- propargylation;
- deprotection; and
- enzymatic cleavage of the glutamyl residue.

- We have now developed an improved route to this key intermediate in which
- 15 the propargyl group is introduced in the penultimate step using the  $(\text{propargyl})\text{Co}_2(\text{CO})_8^+$  complex as the electrophilic propargyl synthon. Accordingly the present invention comprises a process for the preparation of a cyclopenta[g]-quinazoline of formula (I):

(I)

20

wherein:

R is hydrogen, C<sub>1-4</sub> alkyl, C<sub>2-4</sub> alkenyl, C<sub>2-4</sub> alkynyl, C<sub>1-4</sub> halogenoalkyl or C<sub>1-4</sub> cyanoalkyl; or

- R is a group A(CH<sub>2</sub>)<sub>p</sub>, where A is R<sup>0</sup>O or R<sup>0</sup>R<sup>1</sup>N wherein R<sup>0</sup> and R<sup>1</sup> are each independently hydrogen, C<sub>1-4</sub> alkyl, C<sub>3-4</sub> alkenyl, C<sub>3-4</sub> alkynyl, C<sub>2-4</sub> hydroxyalkyl, C<sub>2-4</sub> halogenoalkyl or C<sub>1-4</sub> cyanoalkyl, or R<sup>0</sup> and R<sup>1</sup> together with the intermediate N form a five- or six-membered heterocyclic ring and p is an integer in the range 0 to 4; and

- Ar<sup>1</sup> is phenylene, thiophenediyl, thiazolediyl, pyridinediyl or pyrimidinediyl which may optionally bear one or two substituents selected from halogeno, hydroxy, amino, nitro, cyano, trifluoromethyl, C<sub>1-4</sub> alkyl and C<sub>1-4</sub> alkoxy;

or an ester or amide thereof;

including the step of reacting an ester or amide of formula (II):

(II)

- wherein R and Ar<sup>1</sup> are as defined above and X is an alkoxy, aryloxy or optionally substituted amino group; or a protected derivative thereof; with a complex containing the (propargyl)Co<sub>2</sub>(CO)<sub>6</sub><sup>+</sup> ion.

- The complex containing the (propargyl)Co<sub>2</sub>(CO)<sub>6</sub><sup>+</sup> ion is preferably the tetrafluoroborate salt of formula (propargyl)Co<sub>2</sub>(CO)<sub>6</sub><sup>+</sup> BF<sub>4</sub><sup>-</sup>. This is conveniently prepared from the corresponding hydroxy derivative HO(propargyl)Co<sub>2</sub>(CO)<sub>6</sub> by reaction with a solution of HBF<sub>4</sub> in diethyl ether. It may also be prepared *in situ* by treatment of the corresponding hydroxy derivative HO(propargyl)Co<sub>2</sub>(CO)<sub>6</sub> with a Lewis acid such as BF<sub>3</sub>·Et<sub>2</sub>O. The hydroxy derivative itself may be made by reacting the commercially available cobalt complex dicobalt octacarbonyl [Co<sub>2</sub>(CO)<sub>8</sub>] with propargyl alcohol in dichloromethane.

- The reaction of the ester or amide of formula (II) with a complex containing the (propargyl)Co<sub>2</sub>(CO)<sub>6</sub><sup>+</sup> ion is an example of the Nicholas reaction (see K.-D. Roth and U. Muller, *Tetrahedron Letters* 1993, 34, 2919 and K. L. Salazar and K. M. Nicholas, *Tetrahedron* 2000, 56, 2211). It has never been used in the context of

cyclopenta[g]quinazoline derivatives, however. Reaction is conveniently performed in an anhydrous organic solvent, such as dichloromethane, in the presence of an organic base such as *N,N*-diisopropylethylamine at room temperature.

The reaction can be performed in an anhydrous organic solvent such as dichloromethane or dimethoxyethane (DME) in a presence of a base at temperatures ranging between  $-30^{\circ}\text{C}$  to room temperature under argon. Preferably the reaction is in anhydrous dichloromethane using *N,N*-diisopropylethylamine as the base and at room temperature under argon.

The use of the  $(\text{propargyl})\text{Co}_2(\text{CO})_8^{+}$  ion gives great versatility in the synthetic route that may be used, and the concomitant milder conditions mean that there is no need to have a glutamate group at the right-hand side of the molecule before reaction takes place, as in the prior art process. Thus the reaction can be done using an ester as the compound of formula (II). Conveniently the reaction may be performed on the *tert*-butyl ester of formula (IIA):

(IIA)

The ester functionality can be hydrolysed to the corresponding acid under standard conditions, e.g. with trifluoroacetic acid in the case of the *tert*-butyl ester of formula (IIA).

The ring-closing reaction to create the core of the structure can be performed at a late stage in the reaction sequence. It can be achieved via the step:

IIIA

IIA

This means the reaction scheme is significantly different from the published one. It also has the advantage that the oxidation step to introduce the ketone group (which is then reacted further) is done early in the scheme. This step produces two positional isomers:

5

and the first of these may be discarded so there is no need to use double the amount of reagents later on. This oxo functionality, required for the formation of the C<sup>6</sup>-N<sup>10</sup> bond via a reductive amination reaction, is introduced in the initial steps of the synthesis, whereas the cyclopenta[g]quinazoline ring is constructed after the formation of the C<sup>6</sup>-N bond, making this route simpler and more flexible. This compares favourably with the prior art process, where the compound:

10

had to be discarded in the later stages of the synthesis.

15

Thus in a further aspect of the invention there is provided a process for the preparation of a cyclopenta[g]quinazoline of formula (I) including the step of ring-closing a compound of formula (III):

20

wherein R and Ar<sup>1</sup> are as defined above and X is an alkoxy, aryloxy or optionally substituted amino group;  
or a protected derivative thereof;  
to form a compound of formula (II) as defined above;  
or a protected derivative thereof.

Various reaction conditions are possible. Acidic conditions might be used (acetic acid/sulfuric acid, 100 °C, stirring for a few hours) as reported by R. H. Lemus *et al.*, *J. Org. Chem.* 1992, 57, 5649-5660) for the preparation of quinazolin-4-ones from *o*-amidobenzamides. The use of hydrogen peroxide in basic conditions is  
5 however preferred. For example, conditions similar to those used to make quinazolin-4-ones from *ortho*-amidobenzonitriles with urea-hydrogen peroxide, water / acetone and potassium carbonate are possible (see B. P. Bandgar, *Synth. Communications*, 1997 27(12), 2065-2068). Reaction is conveniently performed using hydrogen peroxide and sodium hydroxide in ethanol and water at elevated  
10 temperature, around 55 °C.

The sequence of steps, by contrast to the prior art sequence discussed above, is now:

- protection (optional);
- oxidation;
- 15 • reductive amination;
- ring closure;
- propargylation; and
- deprotection (optional).

In this specification the terms "alkyl", "alkenyl", "alkynyl" and "alkylene"  
20 include both straight and branched chain groups but references to individual alkyl or alkylene groups, such as "propyl", are specific for the straight chain group only. An analogous convention applies to other generic terms. Moreover, the numbering system used for the cyclopenta[g]quinazoline nucleus is the conventional one as shown below:

25 It will be observed that a cyclopenta[g]quinazoline of the invention contains at least one asymmetric carbon atom [present at the point of attachment of the group amino group to the tricyclic ring system] and can therefore exist in racemic and optically active forms. It is to be understood that this invention encompasses both  
30 racemic and optically active forms of cyclopenta[g]quinazolines, it being a matter of common general knowledge how such optically active forms may be obtained by

stereospecific synthesis or by separation of a mixture of isomeric compounds. It will be appreciated that one isomer may be of more interest than another due to the nature of the activity which the final product exhibits or due to superior physical properties, for example aqueous solubility.

- 5 It is also to be understood that a cyclopenta[g]quinazoline of the formula (I) may exhibit the phenomenon of tautomerism and that the formulae shown in this specification represent only one of the possible tautomeric forms. It is to be understood therefore that the invention is not limited merely to any one-tautomeric form which is illustrated. For example, in the case where R is simply hydroxyl (in  
10 other words a group  $A(CH_2)_p$  where A is HO and p is 0), the a cyclopenta[g]-quinazoline of formula (I) is likely to exist in its keto tautomeric form, i.e. 2-oxo, of formula (IA):

(IA)

- 15 and the intermediates are similarly likely to exist in this form.

It is also to be understood that certain cyclopenta[g]quinazolines of the formula (I) can exist in solvated as well as unsolvated forms such as, for example, hydrated forms.

- A suitable value for R, R<sup>0</sup> or R<sup>1</sup> when it is C<sub>1-4</sub> alkyl, or for a C<sub>1-4</sub> alkyl  
20 substituent which may be present on Ar<sup>1</sup>, is, for example, methyl, ethyl, propyl or isopropyl.

A suitable value for R when it is C<sub>1-4</sub> alkoxy, or for a C<sub>1-4</sub> alkoxy substituent which may be present on Ar<sup>1</sup>, is, for example, methoxy, ethoxy, propoxy, isopropoxy or butoxy.

- 25 A suitable value for a halogeno substituent which may be present on Ar<sup>1</sup> is, for example, fluoro, chloro or bromo.

A suitable value for R when it is C<sub>2-4</sub> alkenyl is, for example, vinyl, prop-2-enyl, but-2-enyl, but-3-enyl or 2-methylprop-2-enyl; and when it is C<sub>2-4</sub>

alkynyl is, for example, ethynyl, prop-2-ynyl or but-3-ynyl. A suitable value for  $R^0$  or  $R^1$  when it is  $C_{3-4}$  alkenyl is, for example, prop-2-enyl, but-2-enyl, but-3-enyl or 2-methylprop-2-enyl; and when it is  $C_{3-4}$  alkynyl is, for example, prop-2-ynyl or but-3-ynyl.

- 5 A suitable value for R when it is  $C_{1-4}$  halogenoalkyl is, for example, fluoromethyl, difluoromethyl, trifluoromethyl or 2-fluoroethyl.

- A suitable value for  $R^0$  or  $R^1$  when it is  $C_{2-4}$  hydroxyalkyl is, for example, 2-hydroxyethyl or 3-hydroxypropyl; when it is  $C_{2-4}$  halogenoalkyl is, for example, 2-fluoroethyl, 2-chloroethyl, 2-bromoethyl, 3-fluoropropyl, 3-chloropropyl or  
10 3-bromopropyl. A suitable value for R,  $R^0$  or  $R^1$  when it is  $C_{1-4}$  cyanoalkyl is, for example, cyanomethyl, 2-cyanoethyl or 3-cyanopropyl.

When  $R^0$  and  $R^1$  together with the intermediate N form a five- or six-membered heterocyclic ring, this may bear substituents, but the ring is preferably an unsubstituted saturated ring such as pyrrolidine or piperidine.

- 15 A suitable value for  $Ar^1$  when it is phenylene is, for example, 1,3- or 1,4-phenylene, especially 1,4-phenylene.

- A suitable value for  $Ar^1$  when it is thiophenediyl is, for example, thiophene-2,4-diyl or thiophene-2,5-diyl; when it is thiazolediyl is, for example, thiazole-2,4-diyl or thiazole-2,5-diyl; when it is pyridinediyl is, for example,  
20 pyridine-2,4-diyl, pyridine-2,5-diyl, pyridine-2,6-diyl or pyridine-3,5-diyl; and when it is pyrimidinediyl is, for example, pyrimidine-2,4-diyl, pyrimidine-2,5-diyl or pyrimidine-4,6-diyl.

- As indicated,  $Ar^1$  may carry one or two substituents. A preferred level of substitution in  $Ar^1$ , where substitution is present, is either two substituents or  
25 especially one substituent; and the one or two substituents may conveniently be at positions adjacent to the atom bonded to the group  $-COOH$ , halogeno substituents such as fluoro being preferred.

- A suitable ester form of a cyclopenta[g]quinazoline of the invention is, for example, an ester with an aliphatic alcohol of up to 6 carbon atoms, for example a  
30 methyl, ethyl or *tert*-butyl ester. The ester should be stable to the conditions used for the ring-closure reaction. A suitable amide is any of the compounds disclosed in WO-A-94/11354 or WO-A-95/30673 (British Technology Group Limited). The contents of these earlier documents are thus incorporated herein by way of reference. Although the process of the invention obviates the need to have to use a compound

having a glutamyl residue which has to be cleaved to generate COOH again, using the expensive carboxypeptidase G enzyme, we have found that the reaction of a protected derivative of a compound of formula (IV):

(IV)

may likewise be reacted with a complex containing the (propargyl)Co<sub>2</sub>(CO)<sub>8</sub><sup>+</sup> ion according to the present invention. With suitable protection, any ester or amide may be used.

A protecting group is conveniently employed where other functional groups are present which could interfere with the reaction (propargyl)Co<sub>2</sub>(CO)<sub>8</sub><sup>+</sup> ion. For example, where a hydroxyl group is present, such as the compound where R is a group A(CH<sub>2</sub>)<sub>n</sub>, where A is HO, a hydroxyl-protecting group may be employed which prevents the -OH from reacting. The hydroxyl group can be protected as the methyl ether—the methyl group can be removed by a Lewis acid such as BBr<sub>3</sub>. Other suitable ether protecting groups are methoxymethyl (MOM), which can be removed with a Lewis acid such as BF<sub>3</sub>·Et<sub>2</sub>O. The *tert*-butyldimethylsilyl group could also be used—this can be cleaved with Bu<sub>4</sub>N<sup>+</sup>F<sup>-</sup>. Preferably a group such as 2,2-dimethylpropionyl, sterically hindered but easily removed by hydrolysis, is used.

When an amino group is present in addition to the one in the N<sup>10</sup> position, this may be protected with conventionally employed peptide chemistry *N*-terminal protecting groups. A suitable protecting group for the amino functionality is benzyl-oxycarbonyl, which can be removed by catalytic hydrolysis, a Lewis acid such as BBr<sub>3</sub> or 30% HBr in acetic acid. The butoxycarbonyl group (BOC) can also be used—this can be removed with trifluoroacetic acid (TFA). The triphenylmethyl group (Tr) can also be used—this can be removed with 80% acetic acid or TFA. A group such as 2,2-dimethylpropionyl could also be a suitable group and could be removed under alkaline hydrolysis conditions.

A preferred cyclopenta[*g*]quinazoline which may be made according to the invention has the formula (I) wherein R is C<sub>1-4</sub> alkyl, C<sub>2-4</sub> alkenyl, C<sub>2-4</sub> alkynyl or a

group  $A(CH_2)_p$ , wherein  $R^0$  and  $R^1$  are each independently hydrogen or  $C_{1-4}$  alkyl, especially methyl; and

wherein  $Ar^1$  is 1,4-phenylene which may optionally bear one or two substituents selected from the group consisting of chloro and especially fluoro, thiophene-2,5-diyl, thiazole-2,5-diyl or pyridine-2,5-diyl.

A preferred value for  $p$  is 1.

An especially preferred cyclopenta[g]quinazoline has the formula (I) wherein  $R$  is methyl, hydroxymethyl or methoxymethyl; and  $Ar^1$  is 1,4-phenylene or 2-fluoro-1,4-phenylene.

Specific particularly preferred cyclopenta[g]quinazolines of formula (I) are:

4-{ $N$ -[(6*RS*)-2-methyl-4-oxo-3,4,7,8-tetrahydro-6*H*-cyclopenta[g]quinazolin-6-yl]- $N$ -(prop-2-ynyl)amino}benzoic acid;

4-{ $N$ -[(6*RS*)-2-methoxymethyl-4-oxo-3,4,7,8-tetrahydro-6*H*-cyclopenta[g]quinazolin-6-yl]- $N$ -(prop-2-ynyl)amino}benzoic acid;

4-{ $N$ -[(6*RS*)-2-(hydroxymethyl)-4-oxo-3,4,7,8-tetrahydro-6*H*-cyclopenta[g]quinazolin-6-yl]- $N$ -(prop-2-ynyl)amino}benzoic acid;

or esters or amides thereof.

Although the compounds of the present invention can exist as a mixture of stereoisomers it is preferred that they are resolved into one optically active isomeric form.

The compound of formula (III) and its halo precursor are key intermediates in the preferred ring-closing process. Thus in a further aspect of the invention there is provided a compound of formula (V):

Merck silica 60 (Art 15111) was used in low-pressure column chromatography. Petrol refers to light petroleum (b.p. 60-80 °C). Electrospray ionisation (ESI) mass spectra were recorded using a TSQ 700 triple quadrupole mass spectrometer (Finnigan MAT) fitted with an electrospray ionisation source (Analytica). Proton NMR spectra were recorded using a Bruker AC250 spectrometer at 250 MHz. Field strengths are expressed in units of  $\delta$  (ppm) relative to

tetramethylsilane, and peak multiplicities are designated as follows: s, singlet; d, doublet; dd, doublet of doublets; dm, doublet of multiplets; t, triplet; q, quartet, br s, broad singlet, m, multiplet. Melting points were determined on a Kofler block and are uncorrected. Elemental analyses were determined by C.H.N. Analysis Ltd., Leicester, UK.

This compound was prepared as described in *J. Med. Chem.*, 1995, 38, 4897 (Li *et al.*). To a solution of 5-acetamido-6-bromoindan (5.74 g, 22.6 mmol) in glacial acetic acid (52 ml) heated at 55 °C was dropwise added a solution of CrO<sub>3</sub> (9.04 g, 90.4 mmol) in aqueous glacial acetic acid, (52 ml v/v 1:1) over a 20 min period. The dark red mixture was then stirred at this temperature for 20 min. The reaction mixture was cooled in an ice-bath, then propan-2-ol (15 ml) was added and the mixture was stirred at this temperature for 10 min before being concentrated *in vacuo*. The black residue was broken up with a spatula with the aid of water and then partitioned between water (200 ml) and ethyl acetate (150 ml). The aqueous layer was extracted with more ethyl acetate (2 x 150 ml); the combined extracts were dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated *in vacuo* to give a white residue. Purification by column chromatography using a gradient of ethyl acetate in dichloromethane (10 to 20%) afforded in order of elution:

**(Propargyl)Co<sub>2</sub>(CO)<sub>6</sub><sup>+</sup>BF<sub>4</sub><sup>-</sup>**

This was prepared as in Example 1 from the dicobalthexacarbonyl propargyl alcohol complex. It was used immediately in the next reaction without any further purification.

*tert*-Butyl 4- $\{N-[(6R\text{S})\text{-}2\text{-methyl-}4\text{-oxo-}3,4,7,8\text{-tetrahydro-}6H\text{-cyclopenta-} [g]\text{quinazolin-}6\text{-yl)]\text{-}N\text{-(prop-2-ynyl)amino}\}\text{-}2\text{-fluorobenzoate}$

To a round-bottomed flask containing  $(\text{propargyl})\text{Co}_2(\text{CO})_8^+\text{BF}_4^-$  (0.174 g, 0.43 mmol) was added anhydrous dichloromethane (dried by distillation over  $\text{P}_2\text{O}_5$ ; 14 ml). The solution was stirred at room temperature for few minutes under argon, then *tert*-butyl 4- $\{N-[(6R\text{S})\text{-}2\text{-methyl-}4\text{-oxo-}3,4,7,8\text{-tetrahydro-}6H\text{-cyclopenta-} [g]\text{quinazolin-}6\text{-yl)]\text{-}N\text{-(prop-2-ynyl)amino}\}\text{-}2\text{-fluorobenzoate}$  (0.135 g, 0.33 mmol) was added. Stirring was continued at this temperature for 5 min then diisopropylethylamine (0.4 ml) was added and the reaction mixture was stirred at room temperature for 25 min under argon. The reaction mixture was partitioned between ethyl acetate (80 ml) and brine (40 ml). The organic layer was washed with 10% aqueous citric acid (30 ml), brine (40 ml), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated *in vacuo*. Purification by column chromatography, on gradient elution with ethyl acetate in dichloromethane (25 to 50%), gave a red solid 0.140 g (58%);  $^1\text{H-NMR}$  (250 MHz,  $\text{CDCl}_3$ , TMS) 1.58 (s, 9H,  $\text{C}(\text{CH}_3)_3$ ), 2.54 (s, 3H, 2-Me), 2.32, 2.61 (m, each 1H, 7-H), 3.03, 3.23 (m, each 1H, 8-H), 4.55 (ABq,  $J = 16.92$  Hz, 2H,  $\text{N}^{10}\text{-CH}_2$ ), 5.59 (t,  $J = 8.30$ , 1H, 6-H), 6.00 (s, 1H, propargyl complex C-H), 6.59 (d,  $J = 14.52$  Hz, 1H, 3'-H), 6.69 (d,  $J = 8.70$  Hz, 1H, 5'-H), 7.58, 7.98 (s, each 1H, 5-H, 9-H), 7.79 (d,  $J = 8.82$  Hz, 6'-H), 10.96 (s, 1H,  $\text{N}^3\text{-H}$ ). To a solution of this complex (0.100 g, 0.136 mmol) in ethanol (15 ml) was added  $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$  (~2 g). The clear solution was stirred at room temperature for 5 min then a second portion of  $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$  (~1.0 g) was added. The reaction mixture was stirred at room temperature for a longer 25 min then a final portion of  $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$  (~1.2 g) was added. Stirring was continued at room temperature for an extra 35 min, then the reaction mixture was partitioned between ethyl acetate (70 ml) and water (30 ml). The organic layer was washed with brine (2 x 30 ml), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated *in vacuo* to leave a crispy solid.
